Re: Bartolomeo, Elizabeth

Dear Ben:

Elizabeth Bartolomeo returned to my office for follow-up on August 9th, 2004. She reported stable visual acuity which measured 20/200 in each eye with correction at distance. The slitlamp examination remained stable. Intraocular pressures were 14 OD, and 15 OS. The examination of the fundi remained stable. Clinically, I did not detect recurrent fluid. OCT imaging confirmed the absence of recurrent exudation. In both eyes there was preservation of the normal foveal contour. Foveal thickness measured 149 μ OD, and 148 μ OS. The patient will be returning to your office for follow-up in approximately three months.

Many thanks again for allowing me to participate in her care.

Sincerely,

K. Bailey Freund, M.D.
